

ABSTRACT OF THE DISCLOSURE

10021847 "121301
T08T3T 447
A filter device for coffee or the like which includes
an open frame 2 formed of sheet material having predetermined
5 rigidity, such as thick paper, and which is smaller in diameter
than a blind-end frame 3. Both the frames are connected by a
tubular body part 5 formed of deformable sheet material
provided with shape retaining ability having predetermined
10 rigidity and flexibility such as thin paper, non-woven fabric,
etc. to compose a cup-like container body 1 having a wider
bottom in a shape of substantially truncated cone. The filter
device can be placed on a coffee cup for use. When the filter
device is not in use, the open frame 2 is folded and pushed
into the blind-end frame 3 by means of flexibility of the body
15 part 5 and contracted. For use, the open frame 2 is pulled up
to expand the body part 5, and the container body is restored
into the cup-like shape and prepared to be poured with hot
water.
